Patent No. 5217955

TITLE OF INVENTION: TREATMENT OF CANCER WITH PEPTIDE ANALOG

OF BOWBESIN, GRP, LITORIN OR NEUROMEDIN

NUMBER OF SEQUENCES: 42

CURRENT APPLICATION DATA:

APPLICATION NUMBER: US/08/520,225

FILING DATE: 09-MAY-1990

PRIOR APPLICATION DATA:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Score 34; DB 6; Length 9;

Patent No. 5620955
EMBRAL INFORMATION:
APPLICANT: Knight, Martha
APPLICANT: Takahashi, Kazayuki
APPLICANT: Chandrasekhar, Bhaskar
ATTLE OF INVENTION: Bombesin/Gastrin Releasing Peptide Antagonists
NUMBER OF SEQUENCES: 16
                                                                                                                                                                                                                                                                                     RESULT 7
5217955-22
; Patent No. 5217955
; APPLICANT: aBOGDEN, ARTHUR E.; MOREAU, JACQUES-PIERRE
TITLE OF INVENTION: TREATMENT OF CANCER WITH PEPTIDE ANALOG
MOMBER OF SEQUENCES: 4

                                                                                                                                                                     AABO8304-15 represent peptides which have an antiangiogenic effect. The specification describes therapeutically active compositions comprising at least one analogue of somatostatin (chosen from SOMI and SOMI), and at least four analogues chosen from vascactive intestinal peptide (VIP) 1 (a VIP antagonist), VIP2 (a VIP receptor binding inhibitor), VIP3 (a VIP receptor antagonist), The combination of these 7 analogues is known as substance P antagonist). The combination of these 7 analogues is known as wuly-7. MuJ-7 is used as an anticancer drug to restrict tumour growth and spread by inhibiting tumour angiogenesis. MuJ-7, in addition, inhibits metastasis through its antianglogenic activity in all cancers. The peptides are useful for the treatment and prevention of angiogenesis, especially as a result of adenocarcinomas of the colon, breast, lung, prostate, kidney, leukemias or lymphomas.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Secreted protein; human adult testes; nutrition; cytokine; stimulant; cell proilferation; differentiation; immune system; suppressor; ilgand; regulator; hematopolesis; tissue growth; activin; halbin; haemostatic; chemotaxis; chemokinetic; thrombosis; receptor; cadherin; tumour;

It is a potent bombesin antagonist. It may be used for the treatment of e.g. malignant disease, conditions associated with the over-prodn. Of bombesin and conditions associated with failure of normal physiological control of the regulation of gastric acid secretion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The peptide is modified at the N-terminal with a lauryl, palm, \cdot,1 or esp. an octanoyl gp. The Leu at position 7 may be absent. f_{\rm LP} C-terminal (Leu or His) is amidated. The peptides and deri

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is cell signalling protein-8 (CSIGP-8) encoded by CDNA obtained from Incyte clone 054191 of FIBRNOT01 library. It is expressed in cardiovascular, gastrointestinal and nervous tissues and is found to be homologous to putative G-protein-coupled receptor. Fragments of CSIGP encoding nucleic acid can be used as hybridisation probe for detecting CSIGP related sequences or allelic variants. Recombinant CSIGP can be produced in host cells by transforming them with genetically engineered vectors. Agonists or antagonists can be used in the treatment of cell proliferative and inflammatory disorders associated with decreased or increased CSIGP expression. CSIGP is used in the diagnosis, prevention and treatment of cell proliferative disorders like arteriosclerosis, cirrhosis, cancer, hepatitis and inflammatory disorders like AIDS, Addison's disease, multiple sclerosis, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The peptides in this example are bombesin analogues. The peptides were tested in a competitive binding assay and a Phosphatidyl Inositol (PI)-turnover assay in mouse pancreas. None of the peptides demonstrated agonist activity but all inhibited PI-turnover (c.f. stimulation produced by 100nM GRP). Analogues of bombesin are potentially useful for growth therapy and the treatment of digestive disorders, e.g. for stimulating digestion, stimulating growth of tissue in the lung, pancreas and intestine, stimulating NK cell activity against tumour cells and stimulating growth of tumours to increase susceptibility to chemotherapeutic agents.

                                                                                                                                                                                                                                                                                                                                                                                       /note= "N-alpha-acetyl-Gln, N-alpha-octyl-Gln, N-alpha-palmityl-Gln or N-alpha-palmityl-Gln"
saits can be used to treat small cell lung carcinoma, prostatic carcinoma, tumour tissue growth, peptide ulcers, cancer and associated conditions, and to effect antagonism of bombesin/gastrin releasing peptide. Dosage is 0.2-250 mg/kg daily in 1-4 doses, at 5-200 mg/dose.
                                                                                                                         .;

```
type inhibitor peptide. The peptide may be used as an antimitotic and antisecretory peptide. It can control growth of small cell lung and prostatic carcinomas, and it can also inhibit gastric secretions which are causative and symptomatic of peptic ulcers. Administration may be oral but is preferably subcutaneous, intravenous, intranscular or intraperitoneal, by depot injection, by implant preparation or by application to the mucous membranes (e.g. of the nose or bronchial

This peptide is a specifically claimed example of a generic formula. The C-terminal amino acid (Met) of the naturally occurring peptide has been converted to an amide and Phe 8 has been replaced by beta-Leu. Gly 6 has also been replaced by D-Ala. The peptide is useful for treating benign or malignant tissue proliferation, artherosclerosis, gastroincestinal disorders and diabetes. They act as competitive inhibitors of natural peptides, since they bind to the cell receptors but have no biological
                                                                                                                                                                                                                                                                                                                                                                                                                                                 New linear peptide analogues of bombesin - modified to eliminate, biological activity while retaining receptor affinity, for treating cancer, diabetes, etc.
                                                                Bombesin; litorin analogue; linear; receptor affinity; cancer,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Bombesin; litorin analogue; linear; receptor affinity; cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The analogue may also be of a naturally occurring peptide terminating at the C-terminus with a Met residue, such as the 10 amino acid C-terminal region of mammalian GRP or amphibian
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Score 34; DB 12; Length 8; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    These peptides are specifically claimed examples of a generic formula. The C-terminal amino acid (Met) of the naturally occurring peptide has been converted to a methylester.

The peptide is useful for treating benign or malignant tissue proliferation, artherosclerosis, gastrointestinal disorders and diabetes. They act as competitive inhibitors of natural peptides, since they bind to the cell receptors but have no biological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                              New linear peptide analogues of bombesin - modified to eliminate biological activity while retaining receptor affinity, for treating cancer, diabetes, etc.

The patent discloses (1) the peptide sequence of bombesin (BBN), gastrin releasing peptide (GRP), Neuromedin B or Neuromedin C, the peptide sequence having a chlorambucil group attached to the peptide sequence having a chlorambucil group attached to the mainor terminal; (2) a BBN receptor antagonist of formula R4-Asn-R5-Trp-Ala-H1s-Leu-CO-CH2CH2.

R4-H1s-Trp-Ala-R1-R2-H1s-R3-CO-CH2CH3; and (3) a BBN receptor antagonist of formula R4-Asn-R5-Trp-Ala-N1-R2-H1s-Leu-CO-CH2CH2.

In these formulae, R1 = Val Or Thr; R2 = Gly or D-Ala; R3 = Leu or Phe; R4 = N-acetyl, bromoacetyl, chloroacetyl, [bis(2-chloroethyl)-CC aminol-L-phenylalanine or a chlorambucil group; and R5 = Gln or H1s.

The compounds act as potent BBN/GRP-like peptide antagonists. They can be used to inhibit the growth of cells that are sensitive to the growth-promoting effects of BBN, GRP or a related peptide such as pancreatic cells, gastric cells, neurons, hypothalamic cells and cancerous cells or tumours. They can also be used to inhibit the growth of peptide to cells capable or a related peptide of behind the cells capable or control the cells capable or control they can are a related peptide at cells capable or control they can a related peptide at cells capable or control they can a related peptide control they can are control they can a related peptide control they can are control they can a related peptide control they can are c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                binding. They can be used for treating e.g. peptic ulcer, pancreatitis, eating disorders, diabetes, acromegaly, enterocutaneous fistula, psoriasis, growth retardation, gastrointestinal motility disorders or tumours. The terminal structures of the compounds protect them from in vivo proteolysis and provide highly potent antagonist effects that persist for extended periods of time upon administration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence of Bombesin receptor peptide ligand with irreversible
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Score 34; DB 16; Length 8; Pred.                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                  Example of peptide agonist of GRP, neuromedin, bombesin and litorin.
                                                                                    The inventors claim 36 peptides. Also claimed are:
(a) pharmaceutical prepn. of a peptide of the invention; (b) prepn. of the peptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This is a peptide analogue of mammalian gastrin releasing peptide (GRP), neuromedin-B or -C, amphibian bombesin and litorin. It is an agonist of these cpds. and is used to treat smooth muscle proliferation and cancer of the prostate, breast or lung. Residue 6 (Ala) is D-alaine. See also AAR11519-21 and AAR11523-30.
                        Bombesin receptor peptide ligands with irreversible effects - as agonists and antagonists both weak and strong
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            bγ

It is a potent bombesin antagonist. It may be used for the treatment of e.g. malignant disease, conditions associated with the over-prodn. of bombesin and conditions associated with failure of normal physiological control of the regulation of gastric acid secretion.
                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The peptide is modified at the N-terminal with a lauryl, palmitoyl cor esp. an octanoyl gp. The Leu at position 7 may be absent. The C-terminal (Leu or His) is amidated. The peptides and derived salts can be used to treat small cell lung carcinoma, prostatic carcinoma, tumour tissue growth, peptide ulcers, cancer and associated conditions, and to effect antagonism of bombesin/gastrin releasing peptide. Dosage is 0.2-250 mg/Kg daily in 1-4 doses, at 5-200 mg/dose.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New peptide bombesin-GRP antagonists - used as antitumour agreent to treat e.g. leukaemia, small cell lung and prostatic carcinoma and to inhibit gastric acid secretion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0;

                                                                                                          The sequences given in AAR40899-908 are bombesin analogues. These peptides were prepared by solid phase sequential or block synthesis. These peptides act as bombesin antagonists or agonists and have antimitotic and/or anti-secretory activity. They may be used for stimulating digestion in patients, decreasing food intake in patients or stimulating growth of organ tissue of lung, pancreatic or intestinal origin in patients. They can be used for the treatment of gastrointestinal and pancreatic ulcers and for the treatment of

The present sequence represents a bombesin/gastrin releasing peptide type inhibitor peptide. The peptide may be used as an antimit antiseretory peptide. It can control growth of small cell into an prostatic carcinomas, and it can also inhibit gastric secretic are causative and symptomatic of peptic ulcers. Administration or all but is preferably subcutaneous, intravenous, intramusculan cintemperitoneal, by depot injection, by implant preparation or by application to the mucous membranes (e.g. of the nose or bronchial
                                                                                                                                                                                                                                                                   Bombesin; gastrin releasing peptide; GRP; inhibitor; antagon; small cell lung carcinoma; tumour; frog; antimitotic; antisecr rory;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        "optionally modified by octanoyl, lautoyl or palmitoyl"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New peptide antagonists of bombesin or gastrin releasing peptide are useful as antimitotic and antisecretory agents in treating, e.g., small cell lung carcinoma or peptic ulcers
                                                                                                                                                                                                               Bombesin/gastrin releasing peptide type inhibitor peptide #2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Score 23; DB 20; Length 7;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   qq
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The peptides in this example are bombesin analogues. The peptides were tested in a competitive binding assay and a Phosphatidyl Inositol (PI)-turnover assay in mouse pancreas. None of the peptides demonstrated agonist activity but all inhibited PI-turnover (c.f. stimulation produced by 100nM GRP). Analogues of bombesin are potentially useful for growth therapy and the treatment of digestive disorders, e.g. for stimulating digestion, stimulating growth of tissue in the lung, pancreas and intestine, stimulating NK cell activity against tumour cells and stimulating growth of tumours to increase susceptibility to chemotherapeutic agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

```
This peptide is a specifically claimed example of a generic formula. The C-terminal amino acid (Met) of the naturally occurring peptide has been converted to an amide and Phe 8 has been replaced by beta-Leu. Gly 6 has also been replaced by D-Ala. The peptide is useful for treating benign or malignant tissue proliferation, artherosclerosis, gastrointestinal disorders and alabetes. They act as competitive inhibitors of natural peptides, since they bind to the cell receptors but have no biological
                                                                                                                                                                                                                                                                New linear peptide analogues of bombesin - modified to eliminate biological activity while retaining receptor affinity, for treating cancer, diabetes, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Bombesin; litorin analogue; linear; receptor affinity; cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The analogue may also be of a naturally occurring peptide terminating at the C-terminus with a Met residue, such as the 10 amino acid C-terminal region of mammalian GRP or amphibian
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Length 8;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The peptide may be preceded by a formyl, acetyl, propionyl, acrylyl or benzoyl group at its C-terminal. The peptide may be used for reducing the body temp. of a mammal, as well as for inducing andlesia. It produces hypothermia when injected i.c., but not when given i.v. or s.c. See also AAP20291-3.

                                                                                                                                                                                                                                                           These peptides are specifically claimed examples of a generic formula. The C-terminal amino acid (Met) of the naturally occurring peptide has been converted to a methylester. The peptide is useful for treating benign or malignant tissue proliferation, artherosclerosis, gastrointestinal disorders and diabetes. They act as competitive inhibitors of natural peptides, since they bind to the cell receptors but have no biological activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                       New linear peptide analogues of bombesin - modified to eliminate biological activity while retaining receptor affinity, for treating cancer, diabetes, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                  The analogue may also be of a naturally occurring peptide terminating at the C-terminus with a Met residue, such as the 10 amino acid C-terminal region of mammalian GRP or amphibian

```
can be used to inhibit the growth of cells that are sensitive to the growth-promoting effects of BBN, GRP or a related peptide such as pancreatic cells, gastric cells, neurons, hypothalamic cells and cancerous cells or tumours. They can also be used to inhibit the binding of BBN, GRP or a related peptide to cells capable of such binding. They can be used for treating e.g. peptic ulcer, pancreatitis, eating disorders, diabetes, acromegaly, enterocutaneous fistula, psoriasis, growth relardation, gastrointestinal motility disorders or tumours. The terminal structures of the compounds protect them from in vivo proteolysis and provide highly potent antagonist effects that persist for extended periods of time upon administration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          e inventors claim 36 peptides. Also claimed are: ) pharmaceutical prepn. of a peptide of the invention; (b) prepn. the peptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence of Bombesin receptor peptide ligand with irreversible
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Bombesin receptor peptide ligands with irreversible effects agonists and antagonists both weak and strong
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                "pMel= p-bis (2-chloroethyl) amino-L-phenylalanine"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The patent discloses (1) the peptide sequence of bombesin (BBN), gastrin releasing peptide (GRP), Neuromedin B or Neuromedin C, the peptide sequence having a chlorambucil group attached to the amino terminal; (2) a BBN receptor antagonist of formula R4-His-Trp-Ala-R1-R2-His-R3-C0-CH2CH3; and (3) a BBN receptor antagonist of formula R4-Asn-R5-Trp-Ala-Val-R2-His-Leu-C0-CH2CH3. In these formulae, R1 = Val or Thr; R2 = G1y or D-Ala; R3 = Leu or Phe; R4 = N-acetyl, bromoacetyl, chloroacetyl, [bis(2-chloroethyl)-R1-L-phenylalanine or a chlorambucil group; and R5 = G1n or His. The compounds act as potent BBN/GRP-like peptide antagonists. They
        a medicament for treating hepatoma. The cpd. acts as antagonist bombesin, which has been detected in a number of human cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Bombesin; antagonist; chlorambucil; peptic ulcer; pancreatitis; eating disorder; diabetes; acromegaly; enterocutaneous fistula; psoriasis; growth retardation; gastrointestinal motility disorder; antitumour.

The C-terminal residue is amidated. This peptide is one of 27 specific examples of a highly generic formula. The peptides are all analogues of either litorin; the 10 amino acid C-terminal region of mammalian GRP, neuromedin B or neuromedin C; or the 10 amino acid C-terminal region of amphibian bombesin. They act as at least partial agonists of the natural peptides. The peptide analogues are made by standard methods of synthesis and can be cyclised.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Peptide agonists of litorin, gastrin releasing peptide - neuromedin B or C or bombesin, for treating cancer, preventing smooth muscle proliferation and suppressing appetite and alcohol
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           tissue proliferation; gastrin related peptide; peptide hormone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Peptide analogue #7 of litorin, GRP, neuromedin or bombesin.

It is an agonist of these cpds. and is used to treat smooth muscle proliferation and cancer of the prostate, breast or lung.

litorin

RESULT 14 AAR14865

SX B

ò

Gaps

::

```
The C-terminal residue is amidated. This peptide is one of 27 specific examples of a highly generic formula. The peptides are all analogues of either litorin; the 10 amino acid C-terminal region of mammalian GRP, neuromedin B or neuromedin C; or the 10 amino acid C-terminal region of amphibian bombesin. They act as at least partial agonists of the natural peptides. The peptide analogues are made by standard methods of Synthesis and can be cyclised.
                                                                                                                                                                                                                                                                         Peptide agonists of litorin, gastrin releasing peptide -
neuromedin B or C or bombesin, for treating cancer, preventing
smooth muscle proliferation and suppressing appetite and alcohol
                                                                                                                                                                            (TULA ) TULANE E FUND ADMINISTRA. (BIOM-) BIOMEASURE INC.

Environ. Microbiol. 59:3150-3153(1993).

-!- FUNCTION: THIS ENZYME CATALYZES THE LIGHT-DEPENDENT MONOMERIZATION (300-600 NM) OF CYCLOBUTYL PYRIMIDINE DIMERS (IN CIS-SYN CONFIGURATION), WHICH ARE FORMED BETWEEN ADJACENT BASES ON THE SAME DNA STRAND, UPON EXPOSURE TO ULTRAVIOLET RADIATION.

-!- CATALYTIC ACTIVITY: CYCLOBUTADIPYRIMIDINE (IN DNA) = 2 PYRIMIDINE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CONTAINS ONE REDUCED FLAVIN (FADH2) CHROMOPHORE THAT IS

The cyanelle genome of Cyanophora paradoxa encodes ribosomal proteins not encoded by the chloroplasts genomes of higher pl.v.ts.";
FEBS Lett. 259:273-280(1990).
-!- CATALYTIC ACTIVITY: GUTPANT-TRNA(GLU) + NADPH = GLUTAMATE 1-
SEMIALDEHYDE + NADP(+) + TRNA(GLU).
-!- PATHWAY: FIRST STEP IN PORPHYRIN BIOSYNTHESIS BY THE C5 PATHWAY.
INVOLVED IN CHLOROPHYLL BIOSYNTHESTS.
-!- SIMILARITY: BELONGS TO THE GLUTAMYL-TRNA REDUCTASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Porphyrin biosynthesis; Chlorophyll biosynthesis; Oxidoreductase; NADP; Cyanelle.
